

Internship Presentation

Ramez Al Masadeh

26-9-2024

Building a better working world

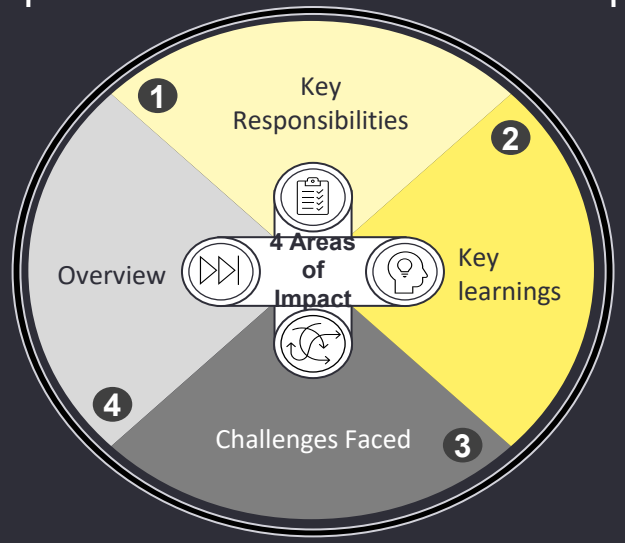

About me and my scope of work this summer

About me

- Ramez Al-Masadeh.
- Finished my 3rd Year Mechatronics and AI Engineering at GJU.
- 3rd summer with EY-P.
- Worked on MIC & DC.

Main Projects

Key Impact Areas

1 Key Responsibilities:

- **Reorganized content, updated templates, and redesigned slides (MIC Moaamah blueprint).**
- **Supported GPLC & PIF clauses analysis: compared clauses vs EY GTC, highlighted deviations, and drafted comments.**
- **DC project current state assessment presentation and onboarding file updates.**

2 Key Learnings:

- Improved **presentation design** and content **structuring skills**.
- Enhanced **understanding** of **contractual clause** comparison and **risk assessment**.
- Strengthened teamwork and communication while collaborating with colleagues.
- Enhancing consulting methodology, worked on different projects on different phases.

3 Challenges Faced:

- Ensuring consistency in visuals and templates across large sets of slides.
- Working on core TSE Functions.
- Balancing multiple tasks for multiple projects.

4 Overview:

This summer, I contributed to projects across MIC Moaamah blueprint, financials, GPLC & PIF, and DC Utility, where each one covering diverse areas such as slide design, financial modeling, contract analysis, and process assessment.The experience strengthened both my technical and soft skills, preparing me for future professional challenges

EY Parthenon

Can AI get Better?

What is AI?

- (AI) is technology that enables computers and machines to simulate human learning, comprehension, problem solving, decision making, creativity and autonomy.

How does AI work?

2 steps: build the model, then apply it.

Example: Predicting the Success of a M&A Transaction.

- **Build:**
  1) **Input variables:** select key factors (e.g., Revenue growth, profit margins, debt levels) influencing the output
  2) **Mathematical form:** Define how inputs are converted to outputs (e.g., linear relationship)
  3) **Optimization:** Determine the best values for model parameters to fit the training data
- **Apply:** use the model to estimate outcomes based on new inputs
- **EYQ:** is a cloud-based generative AI platform. It leverages Microsoft's **Azure OpenAI service** to provide secure AI-powered.
- **Downsides of EYQ:** Security Risks, Long-term Costs, Storage and Processing, and Dependency on External Providers.

My Proposal

Local Based AI Model: is an AI system that runs directly on an EY's own servers, offering more control over data.

The approach is to develop a localized AI, fully deployed and managed on the company's own hardware. This involves building a custom AI model tailored to the company's data and needs, ensuring complete control over the infrastructure and data flow.

Benefits: Enhanced Security, Long-term Cost Efficiency, Customizability, Offline Operation, Full Data Control.

Downsides: Upfront Infrastructure Costs, , Model Size & Hardware Requirements, and Specialized Talent.

Effect on M&A Transactions

- **Data Privacy & Security:** Local-based AI models improve data control during the sensitive phases of M&A transactions**.**
- **Cost Efficiency:** local AI can cut long-term costs and potentially speed up data analysis in M&A.

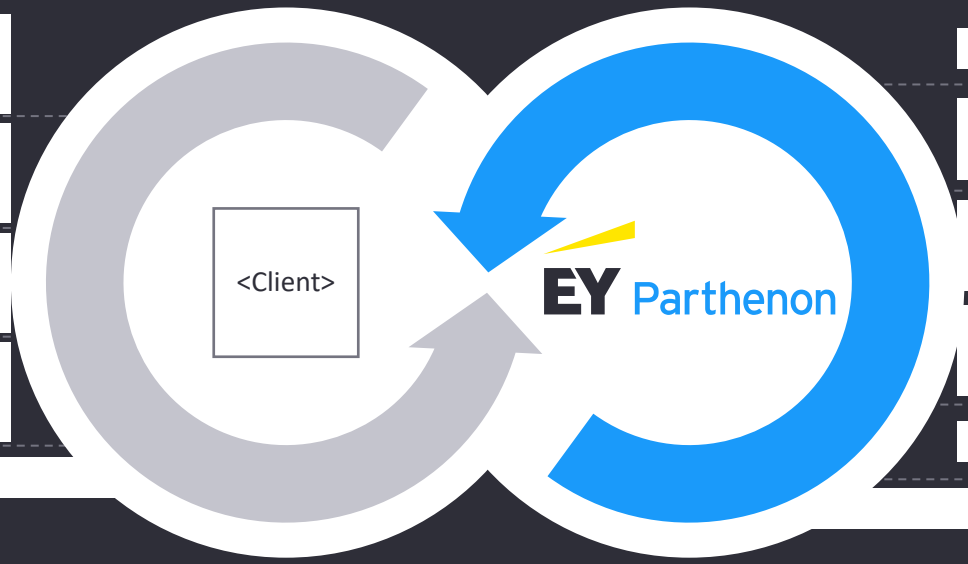

ESG considerations

- **Energy Efficiency:** local AI models can contribute to lower carbon emissions, aligning with ESG goals by reducing the impact of cloud data centers.
- **Governance:** Better governance of data handling, ensuring compliance with ESG criteria.

<Client> and EY-Parthenon together build a strong team

- Trust, respect and flexibility
- Goal orientation
- Transparent and open communication
- Reliable workstream management

- Providing of necessary documents
- Arrangement of important information holders
- Participation in meetings on demand
- Open communication of goals and requirements
- …

- IT expertise and experience
- Motivated, <Client>-experienced team
- Resource-saving integration of the <Client> employees
- Reasonable mix of on-site and remote work
- Clear responsibilities
- …

	About Me	MIC	DC	Random Tasks
Tasks	▪ Identification of the relevant interest groups / "stakeholders“ ▪ Identification of the storage locations ▪ Identification of the contractors ▪ Creation of the contract alignment data model, project plan and "playbook"	▪ Physical capture ▪ Removal of duplicates, elimination of irrelevant contracts, organization according to "contract families“ ▪ Missing contracts analysis	▪ Identification and location of missing / unsigned contracts ▪ Analysis of contracts using machine learning and document review technology ▪ Development of a procedure for the inclusion of required clauses in existing supply contracts (negotiation guide)	▪ Draft necessary contract amendments and contact ▪ Processing and answering questions from suppliers according to the playbook ▪ Review and revise feedback in accordance with the agreed negotiation guide ▪ Tracker and reporting on the status quo
Callenges	▪ List of contract custody (persons and systems) ▪ Tracker for the registration of contracts ▪ Plan for contract recording ▪ Contract data model and analysis plan	▪ Missing documents tracker ▪ Cloud-based storage of contracts ▪ Organized assignment of contracts families	▪ Cloud-based contract document and data storage system ▪ Analysis of status reports ▪ Identification of necessary contracts adjustments ▪ Project plan for contacting contractors (alternative clauses, FAQ’s, escalation procedures, etc.)	▪ Cloud-based storage of the adjusted contracts ▪ Status reports regarding contract adjustments
Key Learnings	▪ Ensuring the completeness of the ▪ relevant "contract universe" ▪ Cost and schedule forecast for the adjustment of contracts	▪ Complete data capture at the beginning of the project reduces rework regarding analysis and creates synergy effects ▪ Centralized contract management	▪ Efficient contract adjustment processing reduces both customer burden and overall costs	▪ Based on our experience from numerous projects, we ensure a smooth incorporation of adapted compliance clauses

German Supply Chain Act: EY Law approach regarding contract adjustments

	1	2	3	4
	Contract identification & planning	**Contract recording**	**Contract analysis**	**Contacting the contractors**
Activities	▪ Identification of the relevant interest groups / "stakeholders“ ▪ Identification of the storage locations ▪ Identification of the contractors ▪ Creation of the contract alignment data model, project plan and "playbook"	▪ Physical capture ▪ Removal of duplicates, elimination of irrelevant contracts, organization according to "contract families“ ▪ Missing contracts analysis	▪ Identification and location of missing / unsigned contracts ▪ Analysis of contracts using machine learning and document review technology ▪ Development of a procedure for the inclusion of required clauses in existing supply contracts (negotiation guide)	▪ Draft necessary contract amendments and contact ▪ Processing and answering questions from suppliers according to the playbook ▪ Review and revise feedback in accordance with the agreed negotiation guide ▪ Tracker and reporting on the status quo
Work results	▪ List of contract custody (persons and systems) ▪ Tracker for the registration of contracts ▪ Plan for contract recording ▪ Contract data model and analysis plan	▪ Missing documents tracker ▪ Cloud-based storage of contracts ▪ Organized assignment of contracts families	▪ Cloud-based contract document and data storage system ▪ Analysis of status reports ▪ Identification of necessary contracts adjustments ▪ Project plan for contacting contractors (alternative clauses, FAQ’s, escalation procedures, etc.)	▪ Cloud-based storage of the adjusted contracts ▪ Status reports regarding contract adjustments
Customer benefits	▪ Ensuring the completeness of the ▪ relevant "contract universe" ▪ Cost and schedule forecast for the adjustment of contracts	▪ Complete data capture at the beginning of the project reduces rework regarding analysis and creates synergy effects ▪ Centralized contract management	▪ Efficient contract adjustment processing reduces both customer burden and overall costs	▪ Based on our experience from numerous projects, we ensure a smooth incorporation of adapted compliance clauses

High level approach

Based on the EDPB guidelines, EY Law has developed a comprehensive concept that is constantly evolving:

Switching to a Local Based AI Model

PMO Operations

In PMO operations I worked with Ishaq Creating a new PMO methodology for the PMO department and managing operations

PMO Governance

Designing the overall governance framework for the PMO department which included: escalation process, meeting cadence and process, reporting process, and change order process.

Other Functions

I worked with Ishaq on different functions related to the strategy, which improved my vision

Switching to a Local Based AI Model

What is AI?

- (AI) is technology that Makes computer think and function as a human.

How does AI work?

2 steps: build the model, then apply it.

Example: Predicting the Success of an M&A Transaction.

- **Build:**
  1) **Input variables:** select key factors (e.g., Revenue growth, profit margins, debt levels) influencing the output
  2) **Mathematical form:** Define how inputs are converted to outputs (e.g., linear relationship)
  3) **Optimization:** Determine the best values for model parameters to fit the training data
- **Apply:** use the model to estimate outcomes based on new inputs
- **EYQ:** is a cloud-based generative AI platform. It leverages Microsoft's **Azure OpenAI service** to provide secure AI-powered.
- **Downsides of EYQ:** Security Risks, Long-term Costs, Storage and Processing, and Dependency on External Providers.

My Proposal

Local Based AI Model: is an AI system that runs directly on an EY's own servers, offering more control over data.

The approach is to develop a localized AI, fully deployed and managed on the company's own hardware. This involves building a custom AI model tailored to the company's data and needs, ensuring complete control over the infrastructure and data flow.

Benefits: Enhanced Security, Long-term Cost Efficiency, Customizability, Offline Operation, Full Data Control.

Downsides: Upfront Infrastructure Costs, , Model Size & Hardware Requirements, and Specialized Talent.

Effect on M&A Transactions

- **Data Privacy & Security:** Local-based AI models improve data control during the sensitive phases of M&A transactions**.**
- **Cost Efficiency:** local AI can cut long-term costs and potentially speed up data analysis in M&A.

ESG considerations

- **Energy Efficiency:** local AI models can contribute to lower carbon emissions, aligning with ESG goals by reducing the impact of cloud data centers.
- **Governance:** Better governance of data handling, ensuring compliance with ESG criteria.
